Sabre Resources hits copper sulphides in Namibia

Wednesday, April 17, 2013 by Angela Kean

Sabre Resources (ASX: SBR) has intersected copper mineralisation at its Guchab copper project in Namibia, with grades of up to 2.81% being unearthed.

Eight diamond drill holes have been completed on Pad 5 at the project, and visual mineralisation has been observed in all holes, including primary copper sulphide in one of the holes.

Highlights include 51.85 metres at 1.35% copper and 15.45 grams per tonne (g/t) silver from 0.31 metres, including 15.28 metres at 2.81% copper and 28.66g/t silver.

Other notable intercepts included 12.22 metres at 0.67% copper and 5.87g/t silver from 20 metres,

including 1.12 metres at 2.14% copper and 4.1g/t silver; and 29.27 metres at 0.8% copper and 10.86g/t silver from 57.37 metres, including 2.58 metres at 2.49% copper at 27.03g/t silver.

Drilling at Guchab continues to intercept epithermal copper mineralisation.

Importantly, the mineralisation at Guchab shows textures evident in fresh mineralisation at the Kombat copper mine 10 kilometres to the west, which indicates the mineralisation at Guchab is the weathered portion of an epithermal deposit.

The main copper minerals within the weathered (oxidised) zone are common ore minerals found in major copper mines.

Sabre plans to assess the metallurgy of both the weathered and fresh mineralisation in due course.

Further results from drilling are pending.

Sabre had a cash position of A\$8.1 million at the end of December 2012.
